

Problem Treasure Hunting

Input `stdin`
Output `stdout`

After he beat Tanaka in last year's cook-off contest (yes, the most important contest in all of INFO(1)CUP KINGDOM), Lulu decided to quit cooking and go *treasure hunting*. But since Tanaka is a very ambitious person, he wants to get his revenge and beat Lulu this time. The hunt takes place inside of a maze which can be represented as a matrix of size $n \times m$. Each cell (x, y) can be either a wall (represented by the character #) or a treasure cell (represented by the character \$). Each treasure cell can contain at most one treasure. Initially, all treasure cells contain a treasure.

We say that the cell (x', y') is reachable from (x, y) if one can get from (x, y) to (x', y') by moving only *down* or to the *right* through treasure cells. Note that a treasure cell is reachable from itself.

The maze has a very interesting property. The cell (n, m) is reachable from any treasure cell and any treasure cell is reachable from $(1, 1)$. Let $F(x, y)$ be the number of treasure cells which contain a treasure and can be reached from (x, y) . We define $F(x, y) = 0$ if (x, y) is a wall. Tanaka thinks that he could get ahead of his opponent by finding S , the sum of $F(x, y)$ for all $1 \leq x \leq n$ and $1 \leq y \leq m$, i.e.

$$S = \sum_{x=1}^n \sum_{y=1}^m F(x, y)$$

But then the real treasure hunt begins! At each moment, one of two things can happen:

1. The cell (x, y) gets an update. If the cell previously had a treasure in it, then the treasure disappears. Otherwise, a treasure appears in the cell (x, y) .
2. Tanaka wants to know $F(x, y)$ for a given cell (x, y) .

Tanaka doesn't have enough time to do all this on his own, so he needs your programming skills. Help Tanaka beat Lulu by writing a program which calculates the value S , then answers all of his queries right.

Input data

The first line of input contains the integers n , m and Q , the number of rows and columns in the matrix and the number of operations you need to process. The next n lines contain m characters, representing the maze. Each of the next Q lines contains an operation, which will be represented as follows:

- `! x y`, which means the cell (x, y) gets an update.
- `? x y`, which means you have to output the value $F(x, y)$.

It is guaranteed that (x, y) is a treasure cell in both cases.

Output data

The first line of output must contain the value S , the sum of $F(x, y)$ for all cells (x, y) in the initial state. Each of the next lines must contain the answers to Tanaka's queries, in order.

Restrictions

- $1 \leq n, m \leq 1\,000$
- $1 \leq Q \leq 50\,000$
- It is guaranteed that both $(1, 1)$ and (n, m) are treasure cells
- 50% of the points for each subtask are awarded for finding S , and the other 50% for answering the queries. Please note that you still have to output the value S , even if it is not correct, in order to get the points for the queries.

| # | Points | Restrictions |
|---|--------|---|
| 1 | 5 | $n = 1$ or $m = 1$ |
| 2 | 7 | All cells (x, y) are treasure cells |
| 3 | 8 | The cell (x, y) is a wall for all $2 \leq x \leq n - 1$ and $2 \leq y \leq m - 1$ |
| 4 | 12 | $n, m \leq 50$ |
| 5 | 18 | $Q \leq 50$ |
| 6 | 27 | $n, m \leq 240$ |
| 7 | 23 | No further restrictions |

Examples

| Input | Output |
|---|--------------------|
| 5 5 5 \$\$\$\$\$ \$\$\$#\$ \$#\$\$\$ \$\$\$#\$ \$\$\$\$\$! 5 4 ? 2 2 ! 4 5 ? 5 5 ? 3 4 | 159 9 1 3 |

Explanations

First example In the initial state, the maze looks like this:

| | | | | |
|----|----|----|----|----|
| \$ | \$ | \$ | \$ | \$ |
| \$ | \$ | \$ | ■ | \$ |
| \$ | ■ | \$ | \$ | \$ |
| \$ | \$ | \$ | ■ | \$ |
| \$ | \$ | \$ | \$ | \$ |

The values $F(x, y)$ for the whole maze are:

| | | | | |
|----|----|----|---|---|
| 22 | 15 | 13 | 6 | 5 |
| 16 | 10 | 9 | | 4 |
| 9 | | 8 | 4 | 3 |
| 8 | 6 | 4 | | 2 |
| 5 | 4 | 3 | 2 | 1 |

For the first query, the maze looks like this:

| | | | | |
|----|----|----|----|----|
| \$ | \$ | \$ | \$ | \$ |
| \$ | \$ | \$ | | \$ |
| \$ | | \$ | \$ | \$ |
| \$ | \$ | \$ | | \$ |
| \$ | \$ | \$ | | \$ |

The red cell is the starting cell and the blue cells are those reachable from it. Cells that contain a treasure are marked with a \$ sign, and cells without are empty. The number of such cells which contain a treasure is 9.

For the second query, the maze looks like this:

| | | | | |
|----|----|----|----|----|
| \$ | \$ | \$ | \$ | \$ |
| \$ | \$ | \$ | | \$ |
| \$ | | \$ | \$ | \$ |
| \$ | \$ | \$ | | |
| \$ | \$ | \$ | | \$ |

The only cell reachable from (5, 5) is (5, 5).

For the third query, the maze looks like this:

| | | | | |
|----|----|----|----|----|
| \$ | \$ | \$ | \$ | \$ |
| \$ | \$ | \$ | █ | \$ |
| \$ | █ | \$ | \$ | \$ |
| \$ | \$ | \$ | █ | \$ |
| \$ | \$ | \$ | | \$ |

The red cell is the starting cell and the blue cells are those reachable from it. The number of such cells which contain a treasure is 3.
